

THE \$1,000 STARTER PROJECT

Your business runs on spreadsheets, texts, and memory. Let's fix that.

I build custom apps for small businesses. We start small: one annoying process, about two weeks, \$1,000 fixed price.

HOW IT WORKS

1

Pick the process

Pick the process that wastes the most of your week. Billing, scheduling, paperwork, reports.

2

We map it together

We talk for 30 minutes. I map exactly what the app must do, around how you already work.

3

Working software

About two weeks later you have working software your team actually uses. Not a proposal. Software.

RECENT WORK

Home care \$1,000 project → full platform

A home-care agency was buried in insurance paperwork. We started with a \$1,000 project: an app that reads claim statements and flags billing errors automatically. It worked, so we kept going. That first project grew into a platform that now runs their billing compliance end to end. The fastest way to trust is working software.

Recruiting

A recruiting agency needed to screen candidates in four languages, around the clock. I built a voice assistant that answers calls in English, Russian, Ukrainian, and Polish, interviews candidates, and files structured summaries. Recruiters start the day with a ranked list instead of a full voicemail box.

Grocery retail

A fresh market was building its weekly ad flyers by hand. I built a tablet app that turns product lists into print-ready promotional graphics. What took days now takes an afternoon.

\$1,000 fixed price

No hourly billing, no surprises. If it earns its keep, we talk about what to automate next. Most clients do. Scan the code or visit the site to claim a starter slot.
